## I. INTRODUCTION

This policy establishes the best management practices for interior integrated pest management (IPM) in the Building. These best management practices mitigate the negative impacts that indoor pest management practices have on building employees, occupants, and operations and maintenance personnel.

The policy is based on the requirements of the LEED-EBOM rating system as excerpted from the 2009 edition – LEED EB-OM: EQ Credit 3.6: Green Cleaning: Indoor Integrated Pest Management:

*Develop, implement and maintain an indoor integrated pest management (IPM) plan, defined as managing indoor pests in a way that protects human health and the surrounding environment and that improves economic returns through the most effective, least-risk option. IPM calls for using least-toxic chemical pesticides, minimum use of chemicals, use only in targeted locations and use only for targeted species. IPM requires routine inspection and monitoring. The plan must include the following elements, integrated with any outdoor IPM plan used for the site as appropriate:*

- Integrated methods, site or pest inspections, pest population monitoring, evaluation of the need for pest control and one or more pest control methods, including sanitation, structural repairs, mechanical and living biological controls, other nonchemical methods, and if nontoxic options are unreasonable and have been exhausted, a least-toxic pesticide.*
- Specification of the circumstances under which an emergency application of pesticides in a building or on surrounding grounds being maintained by building management can be conducted without complying with earlier provisions.*
- A communications strategy directed to building occupants that addresses universal notification, which requires advance notice of not less than 72 hours before a pesticide under normal conditions and 24 hours after application of a pesticide in emergencies, other than a least-toxic pesticide, is applied in a building or on surrounding grounds that the building management maintains.*

*Any cleaning products included in the integrated pest management policy must meet the requirements for EQ credits 3.3-3.5.*

## II. GOALS AND SCOPE

The goal of the Environmental Building Operations Policy for Indoor Integrated Pest Management (IPM) is to effectively treat indoor pest infestations while reducing the exposure of Building occupants and maintenance personnel to hazardous chemicals contained in pesticides and other poisons used to eliminate pests.

The scope of this policy includes the requirements for the pest management in the Building interior spaces. This includes, but is not limited to, the prevention of pest infestations, the use of alternative treatment methods, and focused applications of pest management tools. The policy specifies expectations regarding products, procedures, and communication among building employees and occupants. Service providers are responsible for carrying out their services in accordance with this policy without exception.

### III. RESPONSIBILITIES

Building's property manager will be responsible for informing all building personnel and tenants of this IPM plan. Moreover, the property manager will be responsible for implementing the practices set forth in this document in order to ensure that the standards specified within are upheld.

The property management team may delegate certain duties relating to indoor integrated pest management to staffers or to third-party service providers but will bear ultimate responsibility for the effective implementation of the policy.

## IV. TIME PERIOD

This policy is to take effect immediately. While some outstanding contracts may prevent building operations and maintenance personnel from immediately abiding by certain policy requirements, persons responsible for drafting outsourced indoor pest management contracts will ensure that new policy language is included in all subsequent contracts.

Once the policy is fully implemented and the staff is following the requirements, the performance period will begin. The performance period for which this policy is in effect shall be no longer than a year, at which point the policy will be reviewed and updated.

## V. PERFORMANCE METRICS

Performance will be evaluated by means of a detailed log documenting actions taken and measures implemented in regard to indoor integrated pest management, from both third-party contractor as well as in-house management and maintenance.

## VI. PROCEDURES AND STRATEGIES

IPM is an effective, environmentally friendly approach to pest management that relies on a combination of commonsense practices. IPM programs utilize information on the life cycles of pests and their interaction with the environment to eliminate them through the least toxic means possible.

### A. Establish an IPM Management Team

All personnel, whether service provider employees or internal operations and maintenance staff of the Building, who deal with indoor pest management will be properly educated regarding integrated pest management (IPM) techniques. This education and the subsequent IPM implementation may require the services of an external IPM contractor – someone who is familiar with the requirements for successfully implementing an IPM program. If an IPM contractor is not hired, a staff member will be assigned to oversee the program, but only after they have received the training and/or education required to assume such a position.

### B. IPM Strategies

IPM is focused on preventing pest problems from occurring. This involves minimizing pest access to the Building, and the food and shelter available to it. Consequently, IPM relies heavily on the cooperation and participation of the building employees and occupants, not just the pest control personnel.

Integrated pest management will include the inspection of the architectural barriers around all wall and ceiling penetrations of the Building. One of the simplest ways to combat pests is to make every effort to bar them from entering the building in the first place. Any penetrations or cracks found will be sealed immediately. Additionally, improved sanitation in areas where food is prepared and/or served will deny pests access to food and water. IPM personnel will focus more attention on areas where these types of services are located.

As part of the indoor IPM strategy, a threshold for pest control – a point beyond which pest control action will be taken – will be established. If the quantity of pests exceeds the tolerable number, natural pesticides or trapping strategies will be utilized in lieu of poisons, toxins, or other harmful chemicals which can have an adverse effect on building employees and occupants. Toxins will be used to combat pest only after IPM strategies have repeatedly failed. If chemical poisons must be used, those selected will have the lowest toxicity and the least potential for exposure of humans possible. Least-toxic is defined by those pesticides listed on by the San Francisco Pest Management Program Pesticide Hazard Screening List, Tier III – Low Hazard (Exhibit A).

A focused application of pest management tools will be adopted. Any toxins used will be placed only in targeted areas where pests or evidence of pests has been identified.

**\*Rodent Bait** - If the quantity of rodent pests exceeds a tolerable number and rodent bait must be used, only solid block bait is used. This solid block bait is placed in locked outdoor dispensers in targeted areas where evidence of rodents has been identified.

### **C. Communication and Participation**

Since one of the keys to successful indoor IPM is that pest problems are reported quickly and accurately, Building's management team will educate employees and building occupants about this policy and about IPM protocols. Building employees and occupants will be provided with information on who to contact regarding any pest problems.

If it becomes necessary to use a pesticide other than a least-toxic option, building employees and occupants will be notified not less than 72 hours prior to the application of the product. Only in emergency cases, where employee or occupant safety is threatened, will this notice be reduced to a minimum of 24 hours.

### **D. Proper Monitoring**

After the IPM program has been established, it is important to monitor the results. One of the easiest ways to do this is to ensure the continued participation from Building occupants as well as Building maintenance personnel. Each occupant organization will designate a representative who will communicate on a regular basis with building maintenance staff regarding the efficacy of the interior IPM program.

During periods when pests are present, pest control personnel will adopt a monitoring schedule that consists of daily inspections. When pests are absent, the monitoring schedule will consist of quarterly inspections.

## VII. RECORDKEEPING DOCUMENTS

All documentation relating to the tasks required by this Indoor Integrated Pest Management Policy will be kept on file for purposes of LEED-EBOM (re)certification. A detailed log of actions taken in compliance with this policy will be maintained. This log will include: 1) date of the complaint or finding (if identified by operations and maintenance staff); 2) the location of the problem; 3) detailed description of the problem; and 4) specific information on how the problem was addressed and what the procedure entailed. All operations and maintenance personnel involved in indoor air quality management will have access to this log.

## VIII. REFERENCES

**EPA IPM Principles:** Background information on what is involved in Integrated Pest Management, the various approaches and techniques utilized, and the benefits of using such procedures.
